### **PROJECT DOCUMENT (Phase5)**

## **Noise Pollution Monitoring**

### **INTRODUCTION:**

An initiative to track and monitor noise pollution using noise pollution monitoring system with IoT, A smart way to record noise levels produced in the environment, to reduce the level of pollution in the biosphere. All living beings on this globe should live in a healthy and pollution-free biosphere. This large amount of increasing pollution has made human life prone to many diseases. Therefore, it has now become necessary to control the pollution to ensure healthy livelihood and better future. Here i propose a sound pollution monitoring system that allows us to monitor and check live sound pollution in a particular area through IOT. Also, the system keeps measuring sound level and reports it to the online server over IOT. The sensors interact with microcontrollers which process this data and transmit it over the internet. This allows authorities to monitor noise pollution in different areas and act against it. Also, authorities can keep a watch on the noise pollution near schools, hospitals and no honking areas, and if the system detects noise issues it alerts authorities so they can take measures to control the issue.

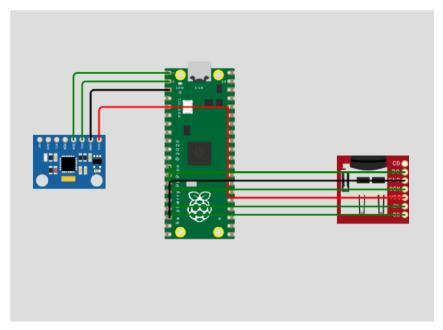

### **OBJECTIVES:**

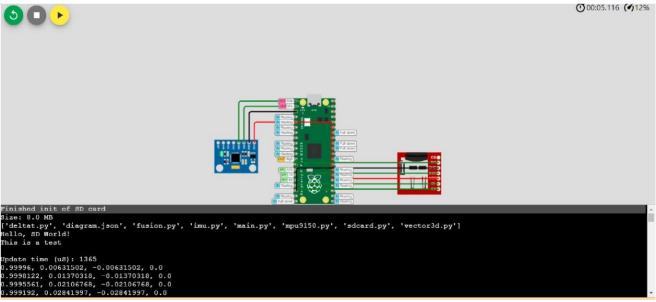

- **O** Real-time Data Collection: To continuously collect and record noise levels in various locations, enabling the creation of accurate noise maps and identifying areas with high noise pollution.
- **O** Environmental Impact Assessment: Evaluate the impact of noise pollution on the environment and public health, including effects on wildlife, vegetation, and human well-being.
- Compliance Monitoring: Ensure compliance with noise regulations and standards by tracking noise levels from different sources, such as industrial facilities, transportation, and construction sites.
- **O** Early Warning and Alerts: Provide timely alerts to authorities, residents, and businesses when noise levels exceed permissible limits, allowing for immediate action to mitigate noise pollution.
- **O Source Identification**: Pinpoint the sources of noise pollution through sound source localization techniques, enabling targeted mitigation efforts.
- O Data Analysis and Trend Monitoring: Analyze historical data to identify trends, patterns, and seasonal variations in noise pollution, facilitating long-term planning and policy developmen

#### **PROGRAM:**

```
# Initialise IMU sda=machine.Pin(0)
scl=machine.Pin(1)
i2c=machine.I2C(0,sda=sda, scl=scl, freq=20000) imu =
fuse = Fusion()
# Initialise SD Card
sd spi = SPI(1, sck=Pin(10, Pin.OUT), mosi=Pin(11, Pin.OUT), miso=Pin(12, Pin.OUT)) sd =
sdcard.SDCard(sd spi, Pin(9, Pin.OUT))
print('Finished init of SD card') print("Size: {}
MB".format(sd.sectors/2048)) print(uos.listdir("/"))
#uos.mount(sd, "/sd") # DEBUGGING THIS STEP NOW
 # Create a file and write something to it
with open("/test01.txt", "w") as file:
     file.write("Hello, SD World!\r\n")
     file.write("This is a test\r")
 # Open the file we just created and read from it
with open("/test01.txt", "r") as file:
    data = file.read()
 # Experimental position calculation section
def calc position(pos init, acc, quat, rate):
     # From https://github.com/thomas-haslwanter/scikit-
 kinematics/blob/master/src/skinematics/imus.py
     # Calculate the position, assuming that the orientation is already known.
    initialPosition = pos init
     # Acceleration, velocity, and position ------
     # From q and the measured acceleration, get the \frac{d^2x}{dt^2}
    g = 9.80665
    g v = np.r [0, 0, g]
    accReSensor = acc - vector.rotate vector(g v, quat.q inv(quat))
    accReSpace = vector.rotate vector(accReSensor, quat)
    # Position and Velocity through integration, assuming 0-velocity at t=0
    vel = np.nan*np.ones like(accReSpace)
    pos = np.nan*np.ones like(accReSpace)
     for ii in range (accReSpace.shape[1]):
         # Swap out scipy.cumtrapz for
https://numpy.org/doc/stable/reference/generated/numpy.trapz.html?
        vel[:,ii] = cumtrapz(accReSpace[:,ii],
                                 dx=1./np.float(rate), initial=0)
        pos[:,ii] = cumtrapz(vel[:,ii],
                    dx=1./np.float(rate), initial=initialPosition[ii])
    return { "vel": vel, "pos": pos }
 # Choose test to run
 Timing = True
 if Timing:
    accel = imu.accel.xyz
    gyro = imu.gyro.xyz
    start = time.ticks us() # Measure computation time only
     fuse.update nomag(accel, gyro) # 979µs on Pyboard
```

## **CIRCUIT & OUTPUT:**

```
inished init of SD card
ize: 8.0 MB
(deltat.py', 'diagram.json', 'fusion.py', 'imu.py', 'main.py', 'mpu9150.py', 'sdcard.py', 'vector3d.py']
ello, SD World!

### GLIMPSE:

The main intent of our project is to monitor the noise pollution in main cities, urban and sub-urban areas, to reduce the amount of noise produced.

To develop our idea, we have implemented IoT in this project to monitor it 24/7 and from anywhere we can access the device and obtain the readings. It involves the use of connected devices and sensors to collect, transmit, and analyze data related to noise levels in various environments of how it works.

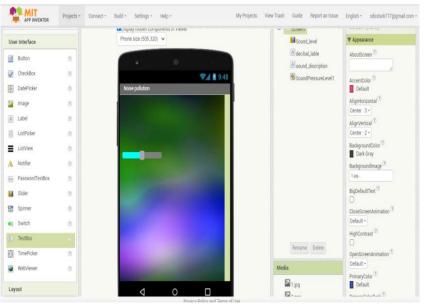

- 1. **IoT Sensors**: The first step is to deploy IoT sensors that are equipped to measure noise levels. These sensors can be placed in urban areas, industrial zones, residential neighborhoods, or near highways and other noisy locations.
- 2. **Data Collection:** The sensors continuously collect data on sound levels, including decibel levels and frequency characteristics. This data is then converted into digital format and transmitted to a central server or a cloud-based platform. This can be done via wired or wireless communication, such as Wi-Fi, cellular networks, or LoRa WAN.
- 3. **Data Transmission**: The collected noise data is transmitted in real-time or at regular intervals to ensure information is up tom date. Data transmission can be

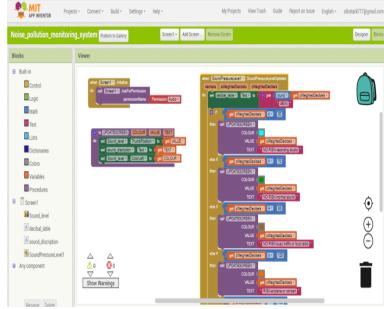

either in a passive mode, where the sensors send data on a schedule, or actively triggered by certain noise threshold levels.

- 4. **Data Storage and Processing**: The data is stored in a central database, either on a cloud-based server or a local server, depending on the project's scale and requirements. Noise Pollution data is then processed to remove outliers and ensure data accuracy.
- 5. **Threshold Monitoring**: Noise pollution monitoring systems can be set up to trigger alarms or notifications when noise levels exceed predefined thresholds. This enables authorities to take timely action and address noise pollution issues.
- 6. **Reporting and Alerts**: The system can generate reports and alerts for relevant stakeholders, including local authorities, environmental agencies, and the public. This information can be used to enforce noise regulations and raise awareness about noise pollution.
- 7. **Integration with Other Systems**: Noise pollution monitoring can be integrated with other IoT systems, such as air quality monitoring or traffic management. This integration provides a more comprehensive view of environmental conditions and their interplay.
- 8. **User Accessibility**: The collected noise data can be made accessible to the public through web portals, mobile apps, or public displays. This promotes transparency and community engagement in addressing noise pollution issues.
- 9. **Privacy Considerations**: Privacy concerns are important when deploying noise monitoring systems, as audio data could inadvertently capture private conversations. Proper measures, including data checking and encryption, should be taken to protect privacy.

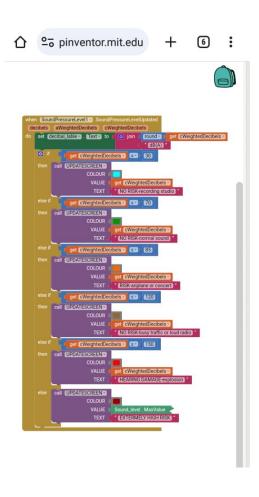

# **Application Development:**

For more convenience we have developed an application for monitoring noise pollution using "MIT App Inventor". This app will perform everything with the help of "Thing speak" connected with a cloud service which will sustain a connection with the internet. This will record the noise levels (in dB) and transfer the data to the application using Thing speak.

### **REFERENCE:**

Certainly! To reference a book for noise pollution monitoring, you can follow the general format for book citations in your chosen citation style (e.g., APA, MLA, Chicago, etc.). Here's a basic example in APA format:

Author(s). (Year of publication). Title of the book. Publisher.

For example, if you're referencing a book on noise pollution monitoring authored by John Smith and published in 2020 by XYZ Publishing, your citation would look like this in APA format:

Smith, J. (2020). Noise Pollution Monitoring: Methods and Applications. XYZ Publishing.

Make sure to replace the author's name, publication year, book title, and publisher with the specific details of the book you're referencing in your work. Additionally, be sure to follow the citation style recommended by your institution or publication guidelines.

Hence our project on Noise Pollution Monitoring System.

#### **CONCLUSION:**

This project will be very significant in many places such as metro cities and areas near them. Unlike India is the developing country where it is much needed to save the globe for next generation from noise pollution which will be a good initiative by us to prevent all such kind of pollution.
